

Laser treatments end embarrassment and *improve well-being*

An involuntary loss of urine is quite common in women, as is a loss of friction and sexual satisfaction. Childbirth, ageing, even weight gain can all overstretch and thin the vaginal wall, causing such problems. Something as simple as a cough or sneeze can stimulate leakage, otherwise known as stress urinary incontinence (SUI). The good news is Dr Sue Feng can treat all those with one non-surgical 15-30 minute in-clinic procedure. The revolutionary process, which is virtually pain-free and safe, combines both the IncontiLase and IntimaLase laser treatments. The procedures involve a special attachment similar to a speculum, as used during a pap test, inserted into the vagina during which the entire vaginal region is treated with short laser pulses through a small handpiece. The laser has a photo-thermal heating effect on collagen in both the vaginal

walls and urethra which causes collagen restructuring and regrowth. The result is a thickening and tightening of the vaginal walls and urethra. Patients normally need 2-3 sessions with a one-month interval. As there is no downtime or discomfort after treatment, you can immediately return to normal, everyday activities. So successful has it been, that 94 per cent of women reported their SUI improved significantly after 120 days and 68 per cent were completely rid of it. While 95 per cent of women indicated they experienced a more than moderate level of vaginal tightening as a result of the IntimaLase treatment, 3 treatments give a much longer, sustainable result.
